Glioblastoma is the most malignant brain tumor that still remains incurable. It is such a deadly disease that patients do not survive more than a few months after diagnosis. Our understanding of the histopathology and molecular mechanisms of formation of glioblastoma is rapidly advancing so as to provide us clues for devising rational therapeutic strategies for treatment of this malignancy. It is important that we continue to improve our knowledge about the pathogenesis of this devastating disease and explore new areas to find successful therapeutic strategies.

Various approaches such as sophisticated imaging techniques, improved surgical procedures, groundbreaking strategies for radiotherapy, chemotherapy, immunotherapy, chemoimmunotherapy, and photodynamic therapy are being used for eradicating glioblastoma. Hopefully, this book will be an important source of information on glioblastoma and therefore be highly useful to the students, postdoctoral fellows, principal investigators, and clinicians involved in this field.
